

**Project Design Phase-II**  
**Solution Requirements (Functional & Non-functional)**

Date	31 January 2025
Team ID	LTVIP2026TMIDS87048
Project Name	Intelligent SQL Querying with LLMs Using Gemini
Maximum Marks	4 Marks

**Functional Requirements:**

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Question Handling	<ul style="list-style-type: none"> <li>• User can enter questions in plain English</li> <li>• System accepts flexible sentence formats</li> <li>• Input validation before processing</li> </ul>
FR-2	LLM-based SQL Generation	<ul style="list-style-type: none"> <li>• Convert user question into SQL query</li> <li>• Use Gemini model for query generation</li> <li>• Ensure SQLite-compatible syntax</li> <li>• Return only SQL without explanations</li> </ul>
FR-3	Database Interaction	<ul style="list-style-type: none"> <li>• Execute generated SQL query</li> <li>• Connect to SQLite database (data.db)</li> <li>• Fetch results from STUDENTS table</li> <li>• Handle invalid queries safely</li> </ul>
FR-4	Output Visualization	<ul style="list-style-type: none"> <li>• Display query results in UI</li> <li>• Show data in readable format (table/list)</li> <li>• Display empty results gracefully</li> <li>• Show execution errors clearly</li> </ul>
FR-5	Transparency & Learning	<ul style="list-style-type: none"> <li>• Show generated SQL query to user</li> <li>• Allow user to verify query</li> <li>• Help users understand SQL logic</li> </ul>
FR-6	System Stability	<ul style="list-style-type: none"> <li>• Handle API errors (quota/model issues)</li> <li>• Handle SQL execution errors</li> <li>• Display user-friendly error messages</li> </ul>

**Non-functional Requirements:**

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	System should provide a simple and intuitive interface where users can easily input questions and view results without SQL knowledge.

NFR-2	<b>Security</b>	API keys and database access must be handled securely. Sensitive data such as credentials should not be exposed in the UI or logs.
NFR-3	<b>Reliability</b>	System should consistently generate valid SQL queries and execute them correctly under normal operating conditions.
NFR-4	<b>Performance</b>	Query generation and execution should occur with minimal delay to ensure smooth user experience.
NFR-5	<b>Availability</b>	System should remain accessible whenever users interact with the application, subject to API service availability.
NFR-6	<b>Scalability</b>	System design should allow future extension to larger databases, additional tables, or alternative LLM models.
